MONOSAN

Additional info

The antibody reacts with the alpha chain the 150 kD molecule of the CD11c/CD18 Integrin complex (g150/95) which is expressed on monocytes and in a lower density on granulocytes and NK-cells of peripheral blood. It also reacts with many myelomonocytic and monocytic leukemias and (weakly) with part of the T8 positive cells (OKM1-like). The Integrins are important molecules in cellular adhesion and cellular interactions. Positive controle perifere blood lymphocytes
