**Additional info**

MRPm6 reacts with an internal epitope of MRP, a 180-195 kD transmembrane transporter protein overexpressed in various human non-P-glycoprotein MDR tumor cell lines. MRPm6 was raised against a bacterial fusion protein of MRP, containing a segment of 170 amino acids in the carboxy terminal end and part of the carboxy proximal nucleotide binding domain of the protein. MRPm6 does not crossreact with the human MDR1 and MDR3 gene products
